<sup>2</sup>School of Computing and Engineering, University of Huddersfield, UK

<sup>3</sup>National Technical University of Ukraine "Igor Sikorsky Kyiv Polytechnic Institute, Ukraine

**Simplicity** of maintenance and renovation:

- Modular design
- Automatic loading/unloading cycle

**Energy saving:**

- Preheating before sintering with the heat released from the container cooling after the sintering process
- Possibility of new reaction sintering approach implementation

**Increased productivity:**

- Incessant sintering process
- Automatic loading/unloading cycle
- Sintering of the preheated container

## Automatic loading/unloading cycle

The preheated container (red) is temporarily removed from the furnace; the cooled container (black) is lifted to the furnace doors

The cooled container (black) is removed from the furnace; the hot container (yellow) is moved down to the cooling chamber

The preheated container (red) is moved inside the sintering chamber; the sintering chamber is locked

New container (blue) is moved inside the preheating chamber to be warmed up with the heat releasing from the cooling container
